

[Core Data](#) / Persistent history

API Collection

Persistent history

Use persistent history tracking to determine what changes have occurred in the store since the enabling of persistent history tracking.

Topics

Tracking History

`class` `NSPersistentHistoryToken`

A bookmark for keeping track the most recent history that you've processed.

Requesting History

`class` `NSPersistentHistoryChangeRequest`

A request to fetch or purge persistent history.

`class` `NSPersistentHistoryResult`

The result of a request to fetch persistent history.

Reading History

`class` `NSPersistentHistoryTransaction`

A set of changes in the persistent history based on a context save or batch operation.

`class` `NSPersistentHistoryChange`

A change representing the insertion, update, or deletion of a managed object in the persistent store.

See Also

Change processing

 Accessing data when the store changes

Guarantee that a context won't see store changes until you tell it to look.

 Consuming relevant store changes

Filter store transactions for changes relevant to the current view.
