

[AVFoundation](#) / [AVCaptureAudioFileOutput](#)

Class

AVCaptureAudioFileOutput

A capture output that records audio and saves the recorded audio to a file.

macOS 10.7+

```
class AVCaptureAudioFileOutput
```

Overview

`AVCaptureAudioFileOutput` implements the complete file recording interface declared by `AVCaptureFileOutput` for writing media data to audio files. In addition, you can configure options specific to the audio file formats, including writing metadata collections to each file and specifying audio encoding options. `AVCaptureAudioFileOutput` does not, however, support `startRecording(to:recordingDelegate:)`—use `startRecording(to:outputFileType:recordingDelegate:)` instead.

Topics

Discovering supported types

```
class func availableOutputFileTypes() -> [AVFileType]
```

Returns an array containing UTIs identifying the file types `AVCaptureAudioFileOutput` can write.

Starting a recording

```
func startRecording(to: URL, outputFileType: AVFileType, recording
Delegate: any AVCaptureFileOutputRecordingDelegate)
```

Tells the receiver to start recording to a new file of the specified format, and specifies a delegate that will be notified when recording is finished.

Configuring output

```
var audioSettings: [String : Any]?
```

The settings used to decode or re-encode audio before it is output by the receiver.

```
var metadata: [AVMetadataItem]
```

A collection of metadata to be written to the receiver's output files.

Creating output

```
init()
```

Creates a new audio file output.
