

[AppMigrationKit](#) / [MigrationStatus](#)

Enumeration

MigrationStatus

A type the containing app uses to determine the status of a completed import.

iOS 26.0+ | iPadOS 26.0+

```
enum MigrationStatus
```

Overview

After the first time the app launches, check this type's static variable `importStatus` to determine whether a migration took place and, if so, whether it succeeded. To determine the status, check to see if `importStatus` is non-`nil` and that its value is `MigrationStatus.success`. After a successful migration, notify the person using the app that migration succeeded, and call the static method `clearImportStatus()`.

Topics

Accessing the import status

```
static var importStatus: MigrationStatus?
```

A property to indicate the status of import from another device into the app.

```
static func clearImportStatus()
```

Sets the import status to a `nil` value to prevent further notification.

Examining migration statuses

`case success`

The migration completed successfully.

`case failure(any Error)`

The migration failed with an error.
