

[App Store Server API](#) / OrderLookupResponse

## Object

# OrderLookupResponse

A response that includes the order lookup status and an array of signed transactions for the in-app purchases in the order.

App Store Server API 1.1+

```
object OrderLookupResponse
```

---

## Properties

<b>status</b> <a href="#">OrderLookupStatus</a>	The status that indicates whether the order ID is valid.
<b>signedTransactions</b> <a href="#">[JWSTransaction]</a>	An array of in-app purchase transactions that are part of order, signed by Apple, in JSON Web Signature format.

## Discussion

The order lookup response contains information about the [orderId](#) you specify when you call [Look Up Order ID](#).

If the `orderId` that you provide in the request is invalid, the response doesn't include the `signedTransactions` array. If the `orderId` is valid, expect at least one transaction in the `signedTransactions` array.
