

Framework

Address Book UI

Access users' contacts and display them in a graphical interface.

iOS 2.0+ | iPadOS 2.0+ | Mac Catalyst 14.0+

Overview

The AddressBookUI framework provides controllers that facilitate displaying, editing, selecting, and creating records in the Address Book database.

Important

Do not use the AddressBookUI framework in iOS 9 and later. Use the APIs defined in the [Contacts UI](#) framework instead.

Topics

People Picker

~~class ABPeoplePickerNavigationController~~

The ~~ABPeoplePickerNavigationController~~ class (whose instances are known as **people-picker navigation controllers**) implements a view controller that manages a set of views that allow the user to select a contact or one of its contact-information items from an address book.

Deprecated

Detail Display

~~class ABNewPersonViewController~~

A view controller presenting an interface to create a contact.

Deprecated

~~class ABPersonViewController~~

The ABPersonViewController class (whose instances are known as **person view controllers**) implements the view used to display a person record (ABPersonRef).

Deprecated

~~class ABUnknownPersonViewController~~

The ABUnknownPersonViewController class (whose instances are known as **unknown-person view controllers**) implements a view controller used to create a person record from a set of person properties.

Deprecated

~~func ABCreateStringWithAddressDictionary([AnyHashable : Any], Bool) → String~~

Returns a formatted address from an address property.

Deprecated
