

[WidgetKit](#) / [DynamicIsland](#) / `widgetURL(_:)`

Instance Method

widgetURL(_:)

Sets the URL that opens the corresponding app of a Live Activity when a user taps on the Live Activity.

iOS 16.1+ | iPadOS 16.1+

```
func widgetURL(_ url: URL?) -> DynamicIsland
```

Parameters

`url`

The URL that opens the app.

Return Value

The configuration object for the Dynamic Island with the specified URL.

Discussion

By setting the URL with this function, it becomes the default URL for deep linking into the app for each view of the Live Activity. However, if you include a [Link](#) in the Live Activity, the link takes priority over the default URL. When a person taps on the Link, it takes them to the place in the app that corresponds to the URL of the Link.
