Nearby Interaction Sessions

Analyze how often your app starts an Ultra Wideband (UWB) ranging session through Nearby Interaction.

Overview

The data in this report details the aggregated number of Ultra Wideband ranging sessions your app starts by using the Nearby Interaction framework.

- Territories: Worldwide
- Platforms: iOS, iPadOS. For more information about iOS and iPadOS, see the Platforms section in [Data Completeness and Corrections](#).
- Availability:
 - Daily: Every day.
- History: On request, data is available beginning with iOS 17.4 and iPadOS 17.4.
- Completeness: Data from devices that contribute to this report can arrive as late as 8 days after the date it generates on device. You can download recent data daily, but it might be incomplete, and data updates incrementally daily, until all late-arriving events are available.
- Privacy:
 - Includes data from users who have opted to share their data with Apple and developers.
 - Individual rows will only appear if they have a value of 5 or more.
- Data Context: You can analyze your data with additional context by comparing it with the data in the [App Sessions Context](#) report, which provides a count of unique devices that use your app on a specific day. For example, if your app performed an action detailed in this report on 10 unique devices on a specific day, and the App Sessions Context report shows there were 100

unique devices running your app that day, then you can approximate that 10% of the devices running your app performed that action.

Report Fields

Report Field	Description	Data Type
Count	Number of times the event occurred	integer
Territory	Country or region in which the event occurred	string
Date	Date when the event occurred	string
Platform	OS version on the device on which the event occurred	string
Device	Type of device on which the event occurred	string
Build	Build of device on which event occurred	string
Unique Devices	The count of unique devices	integer
Release Type	Type of software release	string
Config Type	The session's configuration type, as provided by the app. The configuration type determines how the session operates, for example, "Peer" for Apple to Apple ranging, or "Accessory" for ranging to third-party devices.	string
Configured Background Mode	A configured background mode that is an enumeration.	integer
Is Camera Assistance Enabled	Camera assistance enabled for the session.	boolean
Is Extended Distance Measurement Enabled	True if the app requested the "extended distance measurement" mode, which is available on second-generation Ultra Wideband chips. This mode enables longer operating range.	boolean
Is Live Activity Active	True if the app has an active live activity during the session. If the app has an active live activity, it can continue the session if the app is in the background.	boolean

Glossary

Dimension	Value	Definition
Config Type	Peer	The app started a session between two Apple devices
Config Type	Accessory	The app started a session between an Apple device and a third-party device
