

[App Store Receipts](#) / requestBody **Deprecated**

Object

requestBody **Deprecated**

The JSON contents you submit with the request to the App Store.

App Store Receipts 1.0–1.7 **Deprecated**

object requestBody

Deprecated

The [verifyReceipt](#) endpoint is deprecated.

Properties

~~receipt-data~~
byte

Deprecated **(Required)** The Base64-encoded receipt data.

~~password~~
string

Deprecated Your app's shared secret, which is a hexadecimal string. The password is required for receipts that include subscriptions, and strongly recommended otherwise. For more information about the shared secret, see [Generate a shared secret to verify receipts](#).

~~exclude-old-transactions~~
boolean

Deprecated Set this value to `true` for the response to include only the latest renewal transaction for any subscriptions. Use this field only for app receipts that contain auto-renewable subscriptions.

Discussion

To receive a decoded receipt for validation, send a request with the encoded receipt data and app password to the App Store. For receipts that contain auto-renewable subscriptions, optionally

include an exclusion flag. Send this JSON data using the HTTP POST request method.

See Also

Deprecated

~~verifyReceipt~~

Send a receipt to the App Store for verification.

Deprecated

~~object responseBody~~

The JSON data that returns in the response from the App Store.

Deprecated

~~object error~~

Error information that returns in the response body when a request isn't successful.
