

[App Store Server API](#) / `SendTestNotificationResponse`

## Object

# SendTestNotificationResponse

A response that contains the test notification token.

App Store Server API 1.5+

object `SendTestNotificationResponse`

---

## Properties

**`testNotificationToken`**  
`testNotificationToken`

The test notification token that uniquely identifies the notification test that App Store Server Notifications sends to your server.

## Discussion

The [Request a Test Notification](#) endpoint returns this response, which includes a [testNotificationToken](#) value to reference the test associated with your request. When you request a test notification, the App Store server sends a notification with the [TEST notificationType](#) to your server. To learn the result of the App Store server's attempt to send the TEST notification, call [Get Test Notification Status](#) with the [testNotificationToken](#).

For more information about notifications, see [App Store Server Notifications](#).

---

## Topics

## Data types

`type` `testNotificationToken`

A unique identifier for a notification test that the App Store server sends to your server.

---

## See Also

### App Store Server Notifications testing
