

[SwiftUI](#) / [View](#) / `inspector(isPresented:content:)`

Instance Method

inspector(isPresented:content:)

Inserts an inspector at the applied position in the view hierarchy.

iOS 17.0+ | iPadOS 17.0+ | Mac Catalyst 17.0+ | macOS 14.0+

```
nonisolated
func inspector<V>(
    isPresented: Binding<Bool>,
    @ViewBuilder content: () -> V
) -> some View where V : View
```

Parameters

isPresented

A binding to `Bool` controlling the presented state.

content

The inspector content.

Discussion

Apply this modifier to declare an inspector with a context-dependent presentation. For example, an inspector can present as a trailing column in a horizontally regular size class, but adapt to a sheet in a horizontally compact size class.

```
struct ShapeEditor: View {
    @State var presented: Bool = false
    var body: some View {
        MyEditorView()
    }
}
```

```
        .inspector(isPresented: $presented) {  
            TextTraitsInspectorView()  
        }  
    }  
}
```

Note

Trailing column inspectors have their presentation state restored by the framework.

[InspectorCommands](#) for including the default inspector commands and keyboard shortcuts.

See Also

Presenting an inspector

```
func inspectorColumnWidth(CGFloat) -> some View
```

Sets a fixed, preferred width for the inspector containing this view when presented as a trailing column.

```
func inspectorColumnWidth(min: CGFloat?, ideal: CGFloat, max: CGFloat?)  
-> some View
```

Sets a flexible, preferred width for the inspector in a trailing-column presentation.
