

[Translation](#) / TranslationError

Structure

TranslationError

Error codes describing why the framework can't perform a translation.

iOS 18.0+ | iPadOS 18.0+ | Mac Catalyst 26.0+ | macOS 15.0+

```
struct TranslationError
```

Topics

Handling general errors

```
static let nothingToTranslate: TranslationError
```

No content to translate.

```
static let unableToIdentifyLanguage: TranslationError
```

The framework can't identify the source language automatically.

```
static let internalError: TranslationError
```

An error occurred internal to the translation engine.

```
static let alreadyCancelled: TranslationError
```

An error describing a translation session that you've cancelled before, which prevents the session from producing additional results.

```
static let notInstalled: TranslationError
```

The device doesn't have the necessary languages downloaded to perform a translation and the session can't request the person to download them.

Handling unsupported errors

```
static let unsupportedSourceLanguage: TranslationError
```

The framework doesn't support the specified or detected source language.

```
static let unsupportedTargetLanguage: TranslationError
```

The framework doesn't support the specified or chosen target language.

```
static let unsupportedLanguagePairing: TranslationError
```

The framework doesn't support the specified source and target language pairing.

Describing errors

```
var errorDescription: String?
```

A localized message describing the error.

```
var failureReason: String?
```

A localized message describing the reason for the failure.

Comparing errors

```
static func ~= (TranslationError, any Error) -> Bool
```

This operator allows you to check for a given value of a translation error and handle each error case.
