Property List Key

# com.apple.developer.automatic-assessment-configuration

A Boolean value that indicates whether an app may create an assessment session.

iOS 13.4+ | iPadOS 13.4+ | macOS 10.15.4+

---

## Details

### Type

Boolean

## Discussion

Use an [AEAssessmentSession](#) instance to put a device into a state that prevents users from accessing certain system features during high-stakes assessment activities, such as administering an exam. Your app needs the [com.apple.developer.automatic-assessment-configuration](#) entitlement to create an assessment session.

To add the entitlement to your app, set the entitlement's type to Boolean in the Xcode property list editor, and the corresponding value to YES.

Key	Type	Value
App Sandbox	Boolean	YES
com.apple.security.files.user-selected.read-only	Boolean	YES
com.apple.developer.automatic-assessment-configuration	Boolean	YES

Before your app can use this entitlement, you must first get permission to use it. Request permission by filling in the [Automatic Assessment Configuration Entitlement Request](#) form.

### Important

If your app has a deployment target earlier than macOS 11, to use the [com.apple.developer.automatic-assessment-configuration](#) entitlement, your app also needs the [com.apple.security.temporary-exception.mach-lookup.global-name](#) entitlement. Add this to your app's entitlements file with a corresponding value that's an array of strings containing the string `com.apple.assessmentagent`.
