Overview

The Landmarks app lets people explore interesting sites around the world. Whether it's a national park near their home or a far-flung location on a different continent, the app provides a way for people to organize and mark their adventures and receive custom activity badges along the way.

This sample demonstrates how to refine the system provided glass effect in toolbars. In `LandmarkDetailView`, the sample adds toolbar items for:

- sharing a landmark
- adding or removing a landmark from a list of Favorites
- adding or removing a landmark from Collections
- showing or hiding the inspector

The system applies Liquid Glass to the toolbar items automatically.

Organize the toolbar items into logical groupings

To organize the toolbar items into logical groupings, the sample adds `ToolbarSpacer` items and passes `fixed` as the sizing parameter to divide the toolbar into sections:

```
.toolbar {  
    ToolbarSpacer(.flexible)  
  
    ToolbarItem {  
        ShareLink(item: landmark, preview: landmark.sharePreview)  
    }  
  
    ToolbarSpacer(.fixed)  
  
    ToolbarItemGroup {  
        LandmarkFavoriteButton(landmark: landmark)  
        LandmarkCollectionsMenu(landmark: landmark)  
    }  
  
    ToolbarSpacer(.fixed)  
  
    ToolbarItem {  
        Button("Info", systemImage: "info") {  
            modelData.selectedLandmark = landmark  
            modelData.isLandmarkInspectorPresented.toggle()  
        }  
    }  
}
```
