

[SwiftUI](#) / [View](#) / `id(_:)`

Instance Method

`id(_:)`

Binds a view's identity to the given proxy value.

iOS 13.0+ | iPadOS 13.0+ | Mac Catalyst 13.0+ | macOS 10.15+ | tvOS 13.0+ | visionOS 1.0+ | watchOS 6.0+

`nonisolated`

```
func id<ID>(_ id: ID) -> some View where ID : Hashable
```

Discussion

When the proxy value specified by the `id` parameter changes, the identity of the view — for example, its state — is reset.

See Also

Managing the view hierarchy

```
func tag<V>(v, includeOptional: Bool) -> some View
```

Sets the unique tag value of this view.

```
func equatable() -> EquatableView<Self>
```

Prevents the view from updating its child view when its new value is the same as its old value.
