 Applying Macros

Overview

This macro adds observation support to a custom type and conforms the type to the [Observable](#) protocol. For example, the following code applies the Observable macro to the type Car making it observable:

```
@Observable
class Car {
    var name: String = ""
    var needsRepairs: Bool = false

    init(name: String, needsRepairs: Bool = false) {
        self.name = name
        self.needsRepairs = needsRepairs
    }
}
```
