

[AppMigrationKit](#) / ResourcesExporting

Protocol

ResourcesExporting

A protocol for exporting transportable resources in a streaming archive format when the destination platform doesn't require special migration options.

iOS 26.0+ | iPadOS 26.0+

```
protocol ResourcesExporting : ResourcesExportingWithOptions where Self.OptionsType == MigrationDefaultSupportedOptions
```

Overview

This protocol extends [ResourcesExportingWithOptions](#) and sets its [OptionsType](#) to [MigrationDefaultSupportedOptions](#), which indicates the destination platform doesn't require any special options. If you know your export to the other platform doesn't need these options, conform to this protocol in your app extension and implement the methods and properties defined by [ResourcesExportingWithOptions](#).

As with [ResourcesExportingWithOptions](#), this protocol is only appropriate for transportable resources, those that you can copy as-is from the current file system to the destination device.
