Dictionary

TokenResponse

The response token object returned on a successful request.

AccountOrganizationalDataSharing 1.0+

```
object TokenResponse
```

Properties

access_token string	A token used to access allowed data.
expires_in number	The amount of time, in seconds, before the access token expires.
id_token string	A JWT that contains the user's identity information.
refresh_token string	The refresh token used to regenerate new access tokens when validating an authorization code. Store this token securely on your server. The refresh token isn't returned when validating an existing refresh token.
token_type string	The type of access token, which is always `bearer`.
