Instance Property

accessibilityRole

The type of interface element that the accessibility element represents.

macOS 10.10+

```objc
@property (copy) NSAccessibilityRole accessibilityRole;
```

Discussion

This property contains a nonlocalized string that defines the element's role in the app. For a list of possible roles, see `Roles`. This property is set automatically when you adopt one of the accessibility protocols.

See Also

Assigning roles

`accessibilityRequired`

A Boolean value that determines whether the accessibility element must have content for successful submission of a form.

`accessibilityRoleDescription`

A localized, human-intelligible description of the accessibility element's role, such as *radio button*.

`accessibilitySubrole`

The specialized interface element type that the accessibility element represents.

struct **Role**

Values that describe types of objects that accessibility elements represent.

struct **Subrole**

Values that describe specialized object subtypes that accessibility elements represent.
