Sample Code

Playing Media in a Client-Server App

Play media items in a client-server app using the built-in media player for TVMLKit JS.

Download

tvOS 12.0+ | Xcode 11.2+

Overview

The TVML frameworks provide several built-in ways to play media items. After loading the initial page, the app automatically plays music in the background. The user navigates between two images and the app loads and plays a video or audio media item after the user selects an image. Both of these media items play using the built-in TVMLJKit JS media player.

See Also

Media Playback

`Player`

A media player that displays the UI for playing video and audio in an Apple TV client-server app.
